Skills

AI & Intelligent Automation
Advanced
Agentic AI Workflows, Prompt Engineering, Context Engineering, Loop Engineering, RAG, Pi Agent

Backend Development & APIs
Advanced
TypeScript, Node.js, Python, Java/Spring, SQL

Frontend & UI/UX Engineering
Advanced
JavaScript (ES6+), React.js, Vue.js, Angular, D3.js, HTML5, CSS3

Technical Account Management
Advanced
Client Escalation Management, SSO/LTI/Rostering Integrations, Technical Onboarding, Root Cause Analysis, Cross-Functional Stakeholder Coordination

DevOps, Testing & Tools
Intermediate
Google Cloud, AWS, Docker, Git, browser automation, E2E Testing

Hardware & Systems Engineering
Advanced
Signal Integrity, High-Speed Digital Design, Circuit Analysis, IBIS Modeling, CAD Application Development, FPGA, Verilog

Agentic software engineer with proven track record of leading technical initiatives, architecting production-ready software and delivering scalable enterprise software, APIs, data-intensive systems, and modern web applications across healthcare, education technology, cybersecurity, and business intelligence. Recently focused on building AI-enabled applications that leverage agentic workflows and intelligent automation to solve complex enterprise challenges. Complements engineering depth with technical account management experience, serving as the formal escalation point between client success and engineering teams, resolving critical integration issues, and guiding enterprise clients through complex technical onboardings. Backed by a Master's degree in Electrical Engineering with professional experience in high-speed digital design and circuit analysis. Fluent in both French and English.

Experience

Private Consulting — **June 2026 to Present**
RTL Design & Verification Consultant — Austin, TX

- Debugged RISC-V test failures on the Ariane (CVA6) RV64GC core and OpenPiton platform, tracing root causes through waveforms and simulation logs across pipeline, MMU, cache, and memory subsystem behavior
- Built and configured multi-core RISC-V models using OpenPiton's P-Mesh NoC with Ariane tiles, parameterizing core count and topology for scalable simulation and verification

Edlink — **June 2023 to November 2025**
Software Engineer / Technical Account Solution Engineer — Austin, TX
https://ed.link

- Designed and built a custom SIS data editor as a single-page application, architecting the component structure and state management to support complex, nested data editing workflows.
- Built Edlink's data pipeline monitoring dashboard, creating real-time visualizations and interactive UI components to surface pipeline health and error states to internal teams.
- Designed and developed a branching onboarding application with dynamic, conditional UI flows that adapt to user input in real time.
- Built an AI chatbot front-end to assist clients with technical support questions, implementing a responsive conversational UI with streaming responses and message state handling.
- Implemented Edlink's audit monitoring system, including front-end notification and alerting views alongside email notification delivery.
- Developed a data mapping AI agent to automate data ingestion from custom data sources, including the UI for reviewing and configuring field mappings.
- Developed rostering/coursework APIs, SSO, LTI 1.1 and LTI 1.3 integrations across major and minor SIS/LMS platforms.
- Triaged and resolved critical (P1) integration escalations by isolating root cause across Edlink, client applications, and third-party LMS/SIS providers, owning client communication through resolution as the formal engineering escalation point for the client success team.
- Monitored integration health and data quality across client rosters, investigating sync failures and missing users, classes, and enrollments to identify recurring provider-specific issues before they escalated.
- Guided EdTech clients through implementation planning, defining required integrations (SSO, rostering, grades, coursework) and coordinating milestones between client Product/Engineering teams and Edlink Engineering, providing hands-on support through clients' first five school/district onboardings per Edlink's recommended launch process.
- Led complex school and district onboarding calls, troubleshooting LMS/SIS/IdP-specific authentication, permissions, and data-sharing issues, and diagnosing integration logs to pinpoint failure points for individual district connections.

Medidata **2017 to March 2023**
Staff Engineer Austin, TX
https://www.medidata.com/en/

- Led a team of two data scientists to design and deliver a budget forecasting pipeline for clinical trial management, from architecture through production rollout.
- Designed and directed development of an OCR-based data extraction solution to automate ingestion into the budget forecasting pipeline, eliminating manual data entry.
- Served as lead architect for 1XDS, Medidata's enterprise React design system and Storybook component library, setting technical direction adopted across multiple product teams.
- Drove the technical design of template-based, quick-entry budgeting applications and complex clinical trial workflows, establishing React/Redux architecture patterns used across the platform.
- Pioneered and championed end-to-end testing strategy across multiple core applications, introducing browser automation frameworks that became the standard for quality across teams.
- Led the strangler-fig migration strategy for two legacy Angular 1.5 applications to React, defining the incremental architecture that minimized risk during the transition.
- Mentored and upleveled junior and mid-level engineers on modern React/Redux practices, raising the technical bar across the team.
- Led integration of Pendo Analytics live chat capabilities, aligning engineering, product, and support stakeholders to improve the customer support experience.

Synack **2015 to 2017**
Senior Software Engineer Austin, TX
https://synack.com

- Engineered high-performance, interactive data visualization components (custom charts, graphs, and real-time dashboards) for Synack's security dashboard product using React, D3.js, SVG, and REST APIs.
- Built dynamic, data-driven React components to visualize complex security metrics at scale, optimizing rendering performance for large, frequently-updating datasets.
- Developed Synack's platform messaging system using React, Redux, and Ruby on Rails, architecting a scalable component structure for real-time state management.
- Translated complex security dashboard design mockups into fully responsive, production-ready React applications, ensuring pixel-accurate, performant UI across all data visualization views.

Jobscience **2013 to 2015**
Technical Lead Austin, TX
https://www.linkedin.com/company/jobscience

- Developed mobile job board applications, candidate resume evaluator tools, and custom PDF viewing renderers on the Salesforce platform using Apex, JavaScript, HTML, and CSS.
- Provided technical leadership and code reviews for an offshore engineering team based in Belarus.

Jaspersoft **2011 to 2013**
Senior Software Engineer Austin, TX
https://www.jaspersoft.com

- Created and developed Visualize.js, an award-winning JavaScript framework for embedding interactive dashboards and reports into external web applications.
- Developed big data UI table components capable of rendering over 100,000 tabular data rows efficiently in the browser.
- Engineered cross-browser charting components and reduced overall CSS payload sizes by 25% across Jaspersoft Server web apps.
- Designed and built Java/Spring REST APIs that served query results and report data to the dashboard and visualization front ends.
- Developed server-side Java services for rendering reports to PDF, enabling consistent export of data visualizations from the Jaspersoft platform.

Isola **2010 to 2011**
Software Contractor (contract) Austin, TX
https://www.isola-group.com/

- Architected and developed IsoDesign, the industry's first Web CAD application for high-speed PCB stackup design using JavaScript, SVG, Raphael.js, and MVC design principles.

Force 10 Networks **2006 to 2007**
Signal Integrity Engineer Austin, TX
https://en.wikipedia.org/wiki/Force10

- Executed signal integrity simulations and circuit analysis for 24-layer linecards featuring multi-gigahertz ASICs, DDR2+, QDR2+, and high-speed SerDes channels.
- Procured, validated, and maintained complex IBIS models for high-speed digital board design verification.

Northrop Grumman **2003 to 2005**
Electrical Engineer / Application Support Engineer Austin, TX
https://www.northropgrumman.com/

- Conducted circuit analysis and signal integrity simulations on critical digital modules for the F-22 software radio system and satellite C&DH; subsystems.
- Created and led training programs for Mentor Graphics signal integrity simulation software serving 40+ hardware engineers.

Motorola Computer Group **2000 to 2002**
Signal Integrity Engineer Tempe, AZ
https://emuseum.tempe.gov/objects/2767/motorola--2900-s-diablo-way--tempe-arizona

- Performed signal integrity analysis and IBIS model validations using Mentor Graphics and Cadence SI suites to guarantee signal quality on complex PCB layouts.
- Collaborated directly with IC vendors to acquire and review high-speed component simulation models.

Education

The University of Texas at Austin (McCombs School of Business) **January 2024**
Post Graduate Program in AI and Machine Learning Austin, TX

California State University, Long Beach Long Beach, CA
Master's in Electrical Engineering
